### 1、客户端切片

client 从 server 获取块大小后,对文件进行切片,除最后一块可能小于 block\_size 外,其余块均等于块大小,如 100M 的文件,块大小为 32M,则切成 4 块,分别是 32M、32M、32M、4M

### 2、客户端并发上传和下载

客户端根据用户的设置,可以并发上传或者下载文件,即多个块同时上传和下载。

#### 3、客户端的续传功能

对于下载,客户端会记录下载进度到本地文件,下次下载时加载;对于上传,每次上传前会查询该块是否存在,不存在才上传

# 4、消息

(1)客户端上传下载前,都需要发送查询消息,查询文件大小和块大小 query request:

GET /query?filehash=1235sdfsdf HTTP/1.1\r\n

Host: ip:port\r\n

Connection: keep-alive\r\n

 $\r\n$ 

query response:

HTTP/1.1 200 OK\r\n Content-Length: XX\r\n

 $\r\setminus n$ 

file size=XX&block size=XX

HTTP/1.1 200 OK\r\nContent-Length: 28\r\n\r\nfile\_size=38&block\_size=6400 (2)下载请求

GET /downlaod?filehash=XXXXXXX HTTP/1.1\r\n

Host: ip:port\r\n

Range: bytes=bg\_byte-last\_byte\r\n

Connection: keep-alive\r\n

 $\r\n$ 

(3)

# 块上传请求:

POST /upload?filename=XXX&filesize=XX&filehash=XXXX&blockindex=X HTTP/1.1\r\n

Host: ip:port\r\n

Connection: keep-alive\r\n Content-Length: XX\r\n

 $\r\n$ 

块上传 ok 响应:

HTTP/1.1 200 OK\r\n Content-Length: XX\r\n

\r\n rtn=X
